STARTING OUT

Right Clicking is helpful!
selecting an object and right clicking will list almost every option available to that object

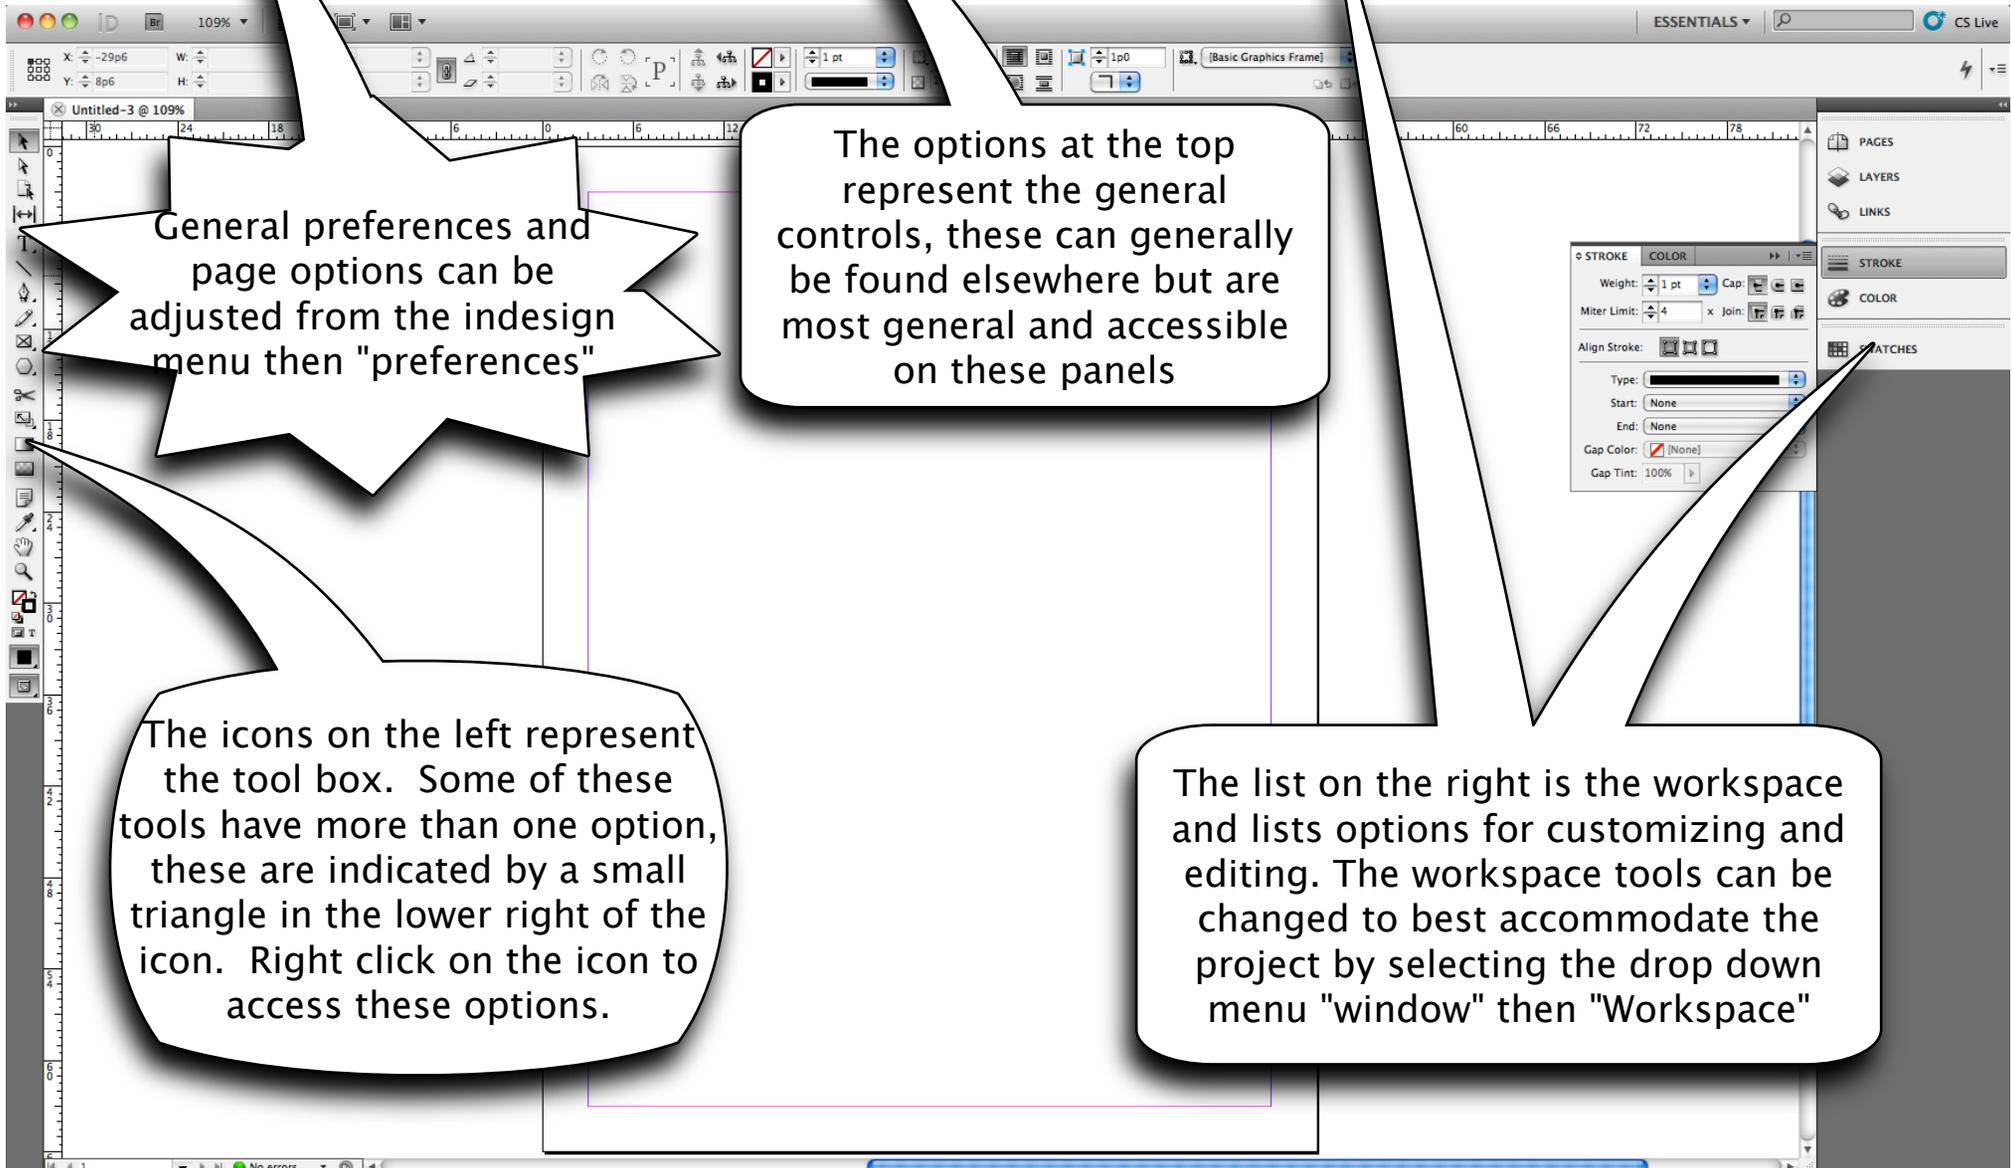

InDesign File Edit Layout Type Object Table View Window Help

General preferences and page options can be adjusted from the indesign menu then "preferences"

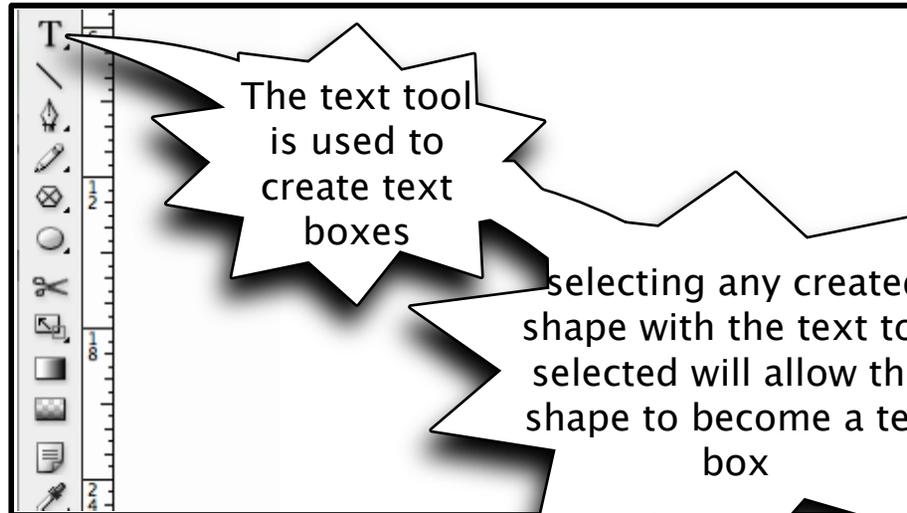

The options at the top represent the general controls, these can generally be found elsewhere but are most general and accessible on these panels

The icons on the left represent the tool box. Some of these tools have more than one option, these are indicated by a small triangle in the lower right of the icon. Right click on the icon to access these options.

The list on the right is the workspace and lists options for customizing and editing. The workspace tools can be changed to best accommodate the project by selecting the drop down menu "window" then "Workspace"

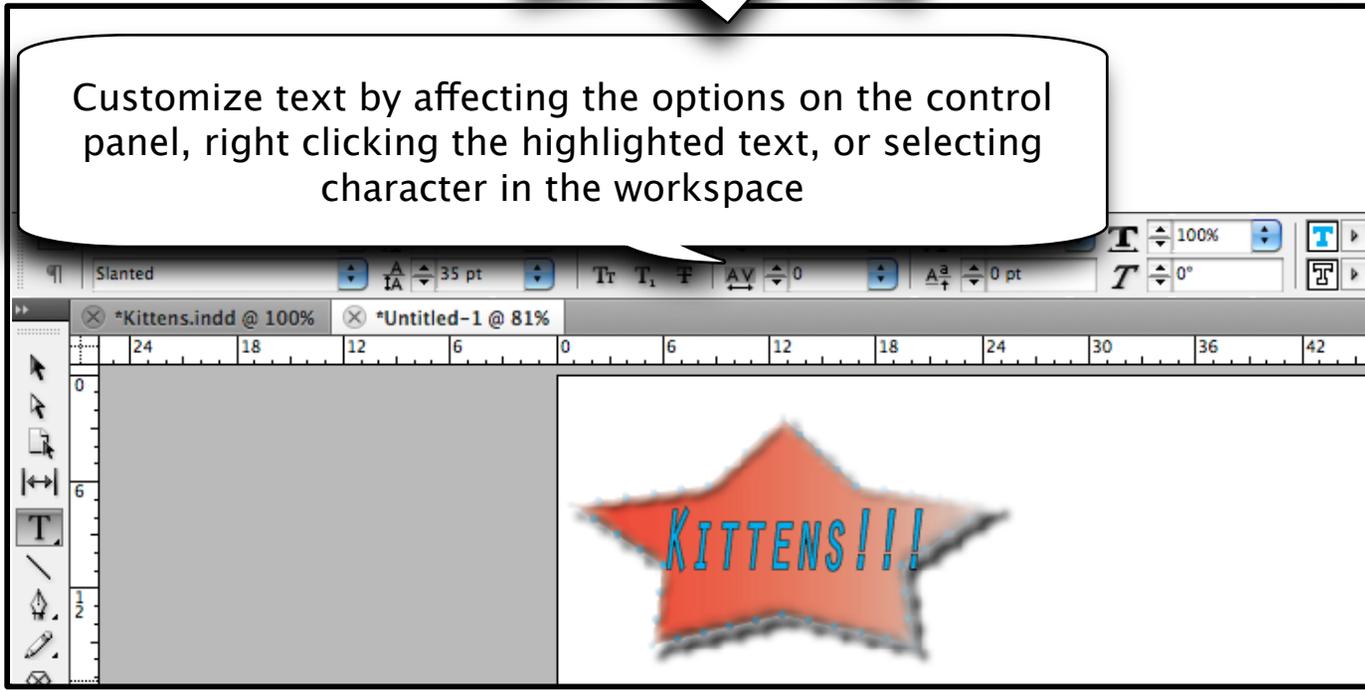

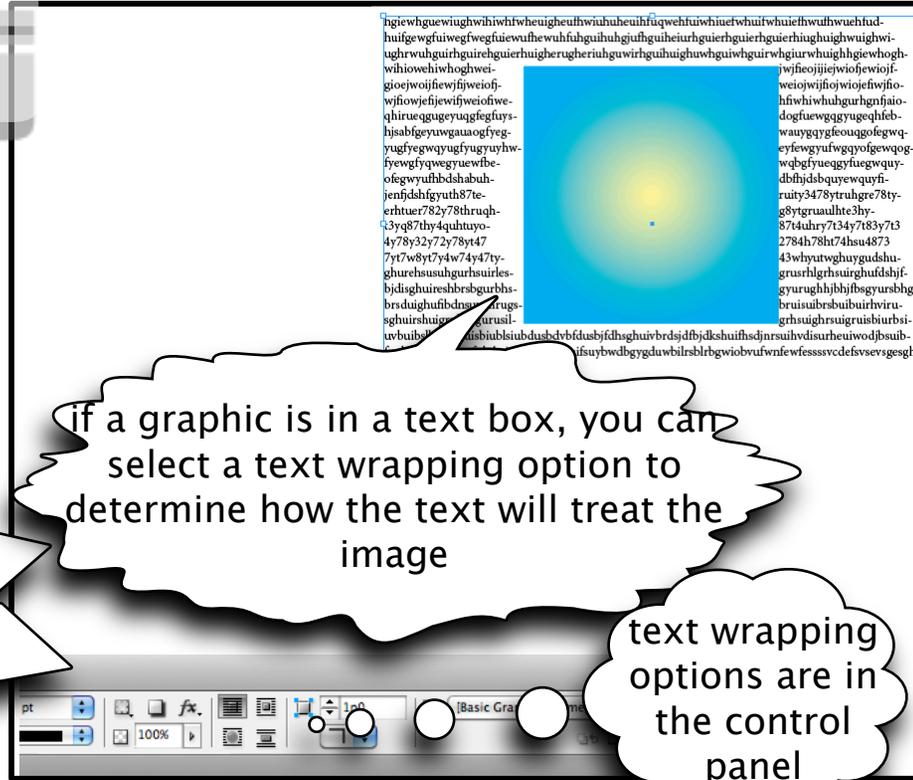

text

The text tool is used to create text boxes

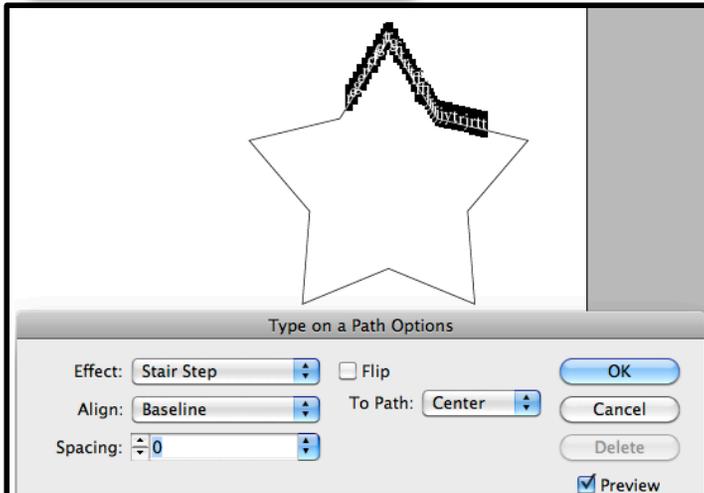

selecting any created shape with the text tool selected will allow that shape to become a text box

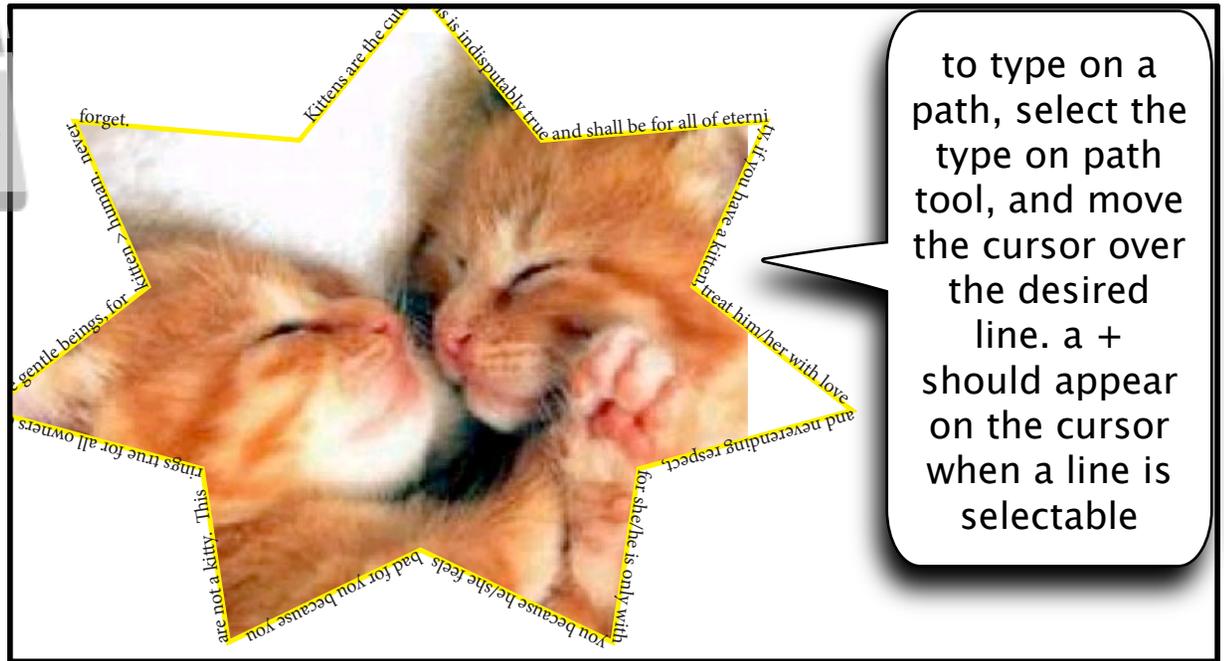

Indesign has no feature similar to wordart, but it allows enough customization to make it all yourself.

SPECIAL TEXT

The alternate option for the text tool is typing on a path.

use the drop down menu "type" or highlight and right click the text on the path to customize the style and orientation of the text on the path

to type on a path, select the type on path tool, and move the cursor over the desired line. a + should appear on the cursor when a line is selectable

Threading text allows connection of text between text boxes

To Thread Text from frame to frame, select the first box in the string, and click the lowest

option box on the right side of the frame, then select the box you'd like to thread it to, an out or in arrow

should appear on the frame.

this arrow shows that this box is threaded with another

to thread, click the lowest box on the right of a text frame

SHAPES

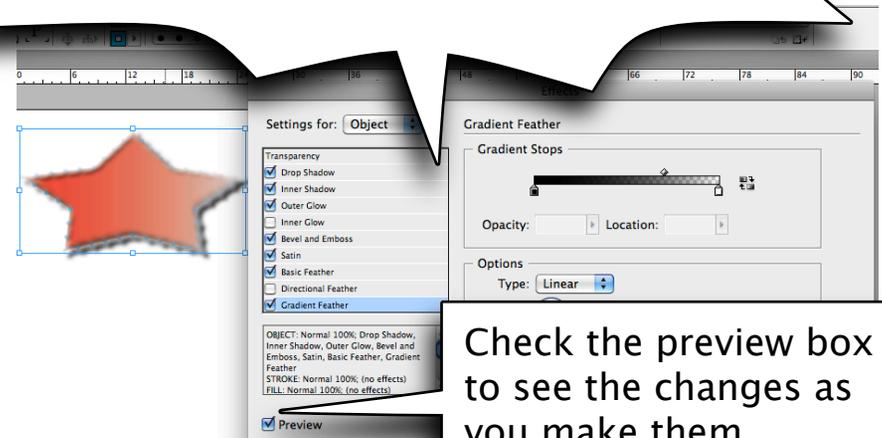

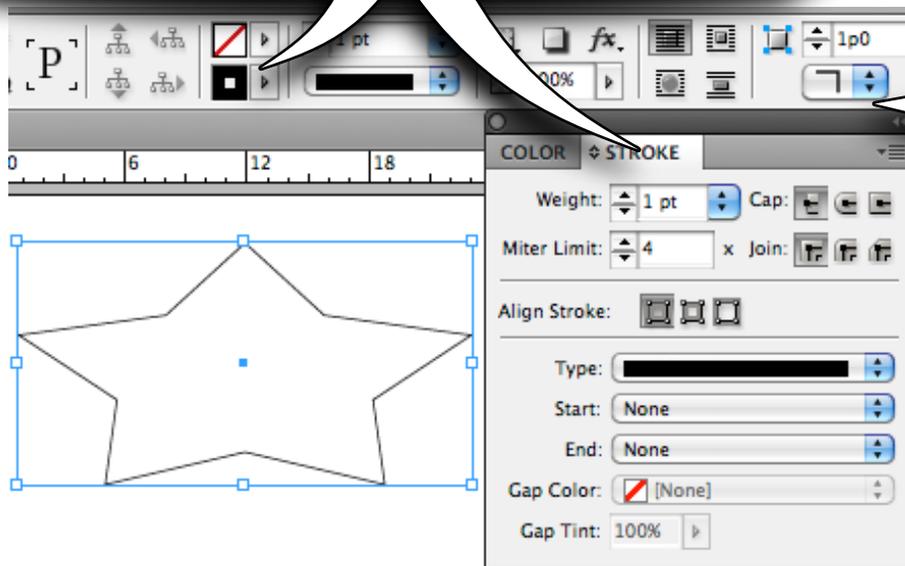

holding shift while dragging any shape will keep the sides of that shape proportional. e.g. holding shift while drawing an ellipse makes a circle

The outline of the shape is affected by the stroke settings, and the color by the fill settings. these can be found in the workspace or control panel

The shape tool allows the quick creation of simple shapes

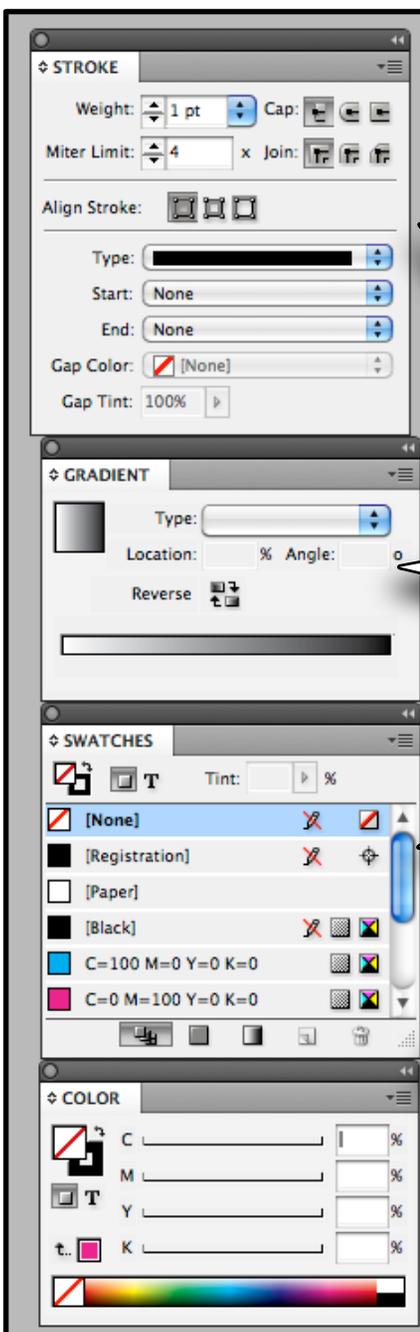

There are multiple options you can access by right clicking or holding a click on the icon. you can also double click the icon for more options of a specific shape

by right clicking and selecting effects or clicking the drop down "object" option, you can change many attributes of the shape

Check the preview box to see the changes as you make them

Color

Stroke adjusts the outline of an object, the weight makes it larger or smaller, the type is the style, and the color can be changed using the swatches

Coloring can be adjusted in most ways with the Color, Stroke, Gradient, and Swatches tabs in the workspace

Gradient affects color change within a fill, allowing a flow from one color to another in any direction or radially. Drag colors from the swatches to the start and end colors and adjust the ramp to change the gradient

The Swatch tab holds colors you are using for easy access

The Color Tab allows customization of colors which can be kept in the swatches tab

stroke and fill can also be adjusted in the control panel

Graphics

To add graphics to your project, you can drag and drop graphics from another folder or use the file menu then select "place".

Graphics brought into indesign have a frame (blue outline) and the graphic itself (orange outline). to resize either you can simply drag the corners or sides (hold shift to maintain proportions) or right click, then select transform, then scale.

To allow a frame of different shape, create the shape and select it, then right click it and select "paste/Place Into"

GROUPING

To Group objects together, hold the shift key and select the objects you want grouped

When the objects are selected, release shift, and right click to select Group, or use the drop down object menu and select group

ARRANGING ITEMS

Indesign will automatically arrange items based on the order they are added to the project (new stuff on top).

To rearrange elements that are out of order, you can right click the item, scroll over "Arrange", and move it backwards and forwards. The "object" drop down menu also has the arrange tab

The Use of Layers tool is very helpful for organizing a project.

the pen icon shows the

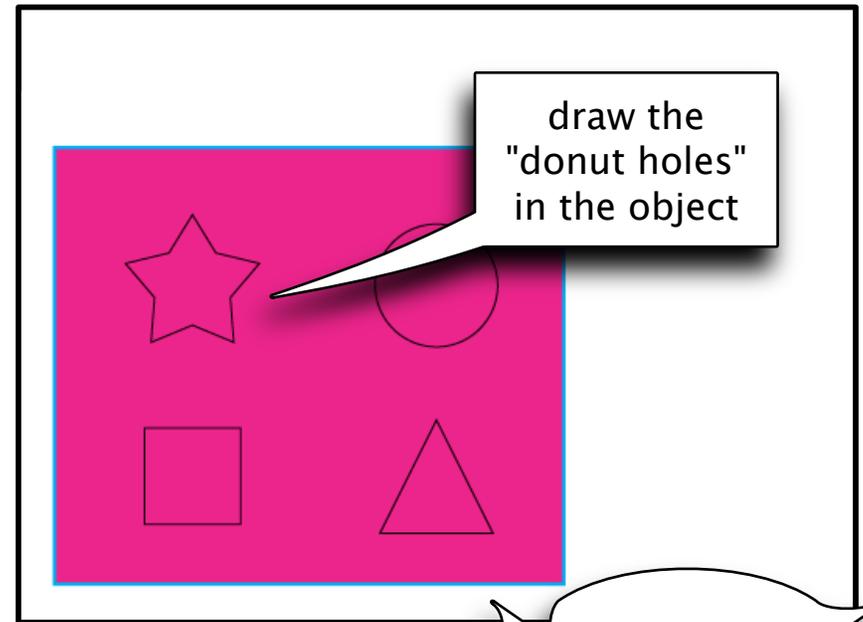

this tool can be used to specifically organize things in Layers. To add a new Layer to your project, you can right click a layer and select "add new layer" or click the menu tab on the layers panel and add a new layer

New Layers will be added on top of all previous layers, to rearrange the layers you can drag them up or down on the list.

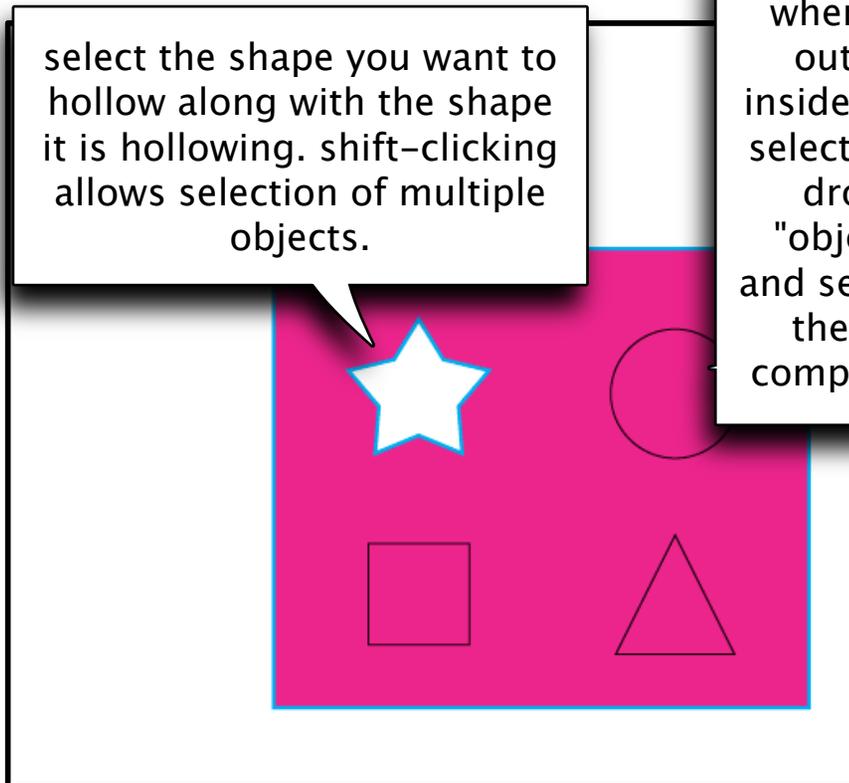

DONUTS

you can create "donut holes" in any shape you create.

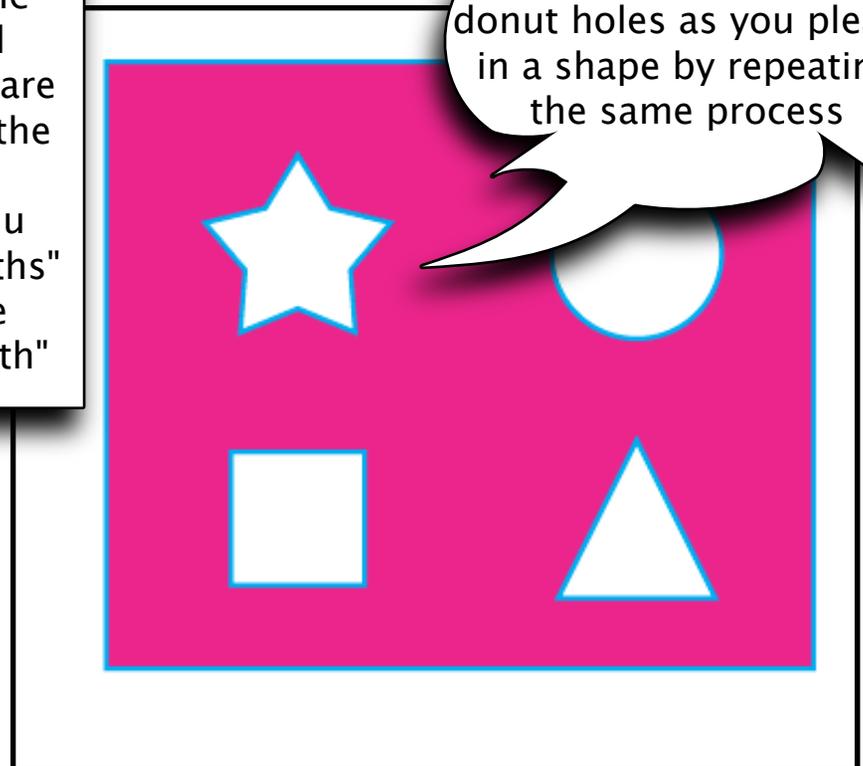

select the shape you want to hollow along with the shape it is hollowing. shift-clicking allows selection of multiple objects.

when both the outside and inside shapes are selected, use the drop down "object" menu and select "paths" then "create compound path"

you can create as many donut holes as you please in a shape by repeating the same process

CLIPPING a GRAPHIC

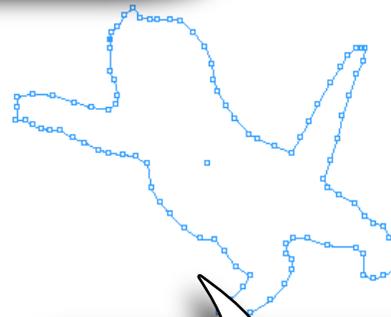

Clipping a photo in indesign simply consists of creating a matching frame for it.

to create an accurate frame, paste the image into indesign and make it the size you want.

Your clipped image is then able to be copied and moved as you please

when the image is the size you desire, use the pen tool to create an accurate frame. when using the pen, you create points and the program connects them, so simply click to create points around the graphic

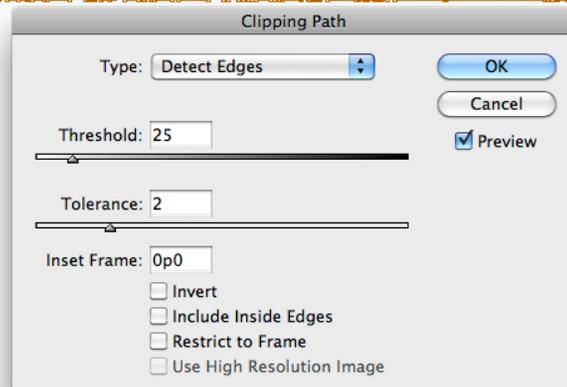

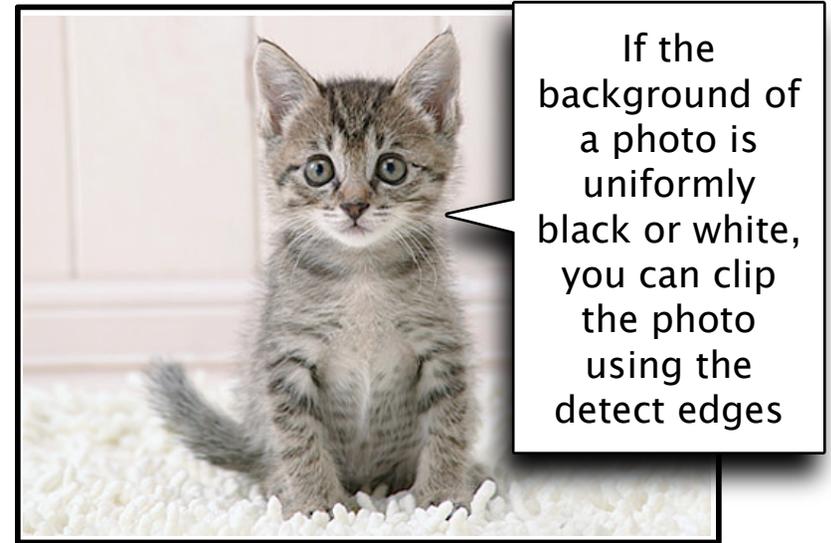

after creating the frame, delete the graphic, leaving the frame

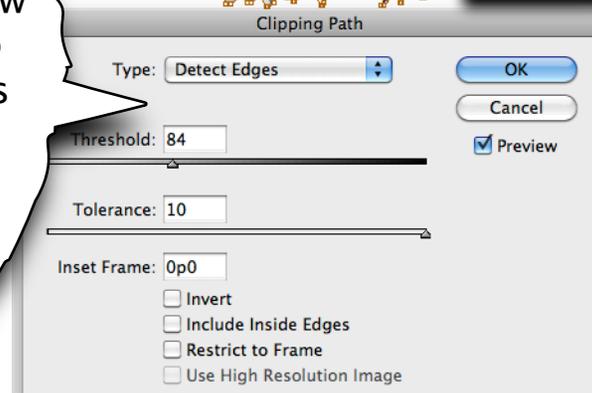

when you have the empty frame, simply paste the graphic into the frame and move it/resize it to fit the frame.

Another way to CLIP

Select the Object, then use the drop down "object menu" to select "clipping path" then "Options". drop down the "type" box and

The threshold number determines the level of white or black that will be removed. The tolerance determines how many points will be used to clip, higher tolerance means less points leading to smoother lines, but less perfect cutting of intended shades

When finished, use the drop down menu "object" then "clipping Path" then select "convert clipping path to frame"

Example

This Project was created with many of the features gone over in this tutorial. more things were explained in this tutorial, and even more are possible; so play with indesign and figure more out! You can even make an interactive project for digital distribution.
