

# Singer Start Machine Tutorial

---

These sections will help guide the thread to its destination

Place the bobbin here to thread it

This nob manually controls the needle's position

The bobbin holder is in this large removable compartment

Disclaimer: As you move along this tutorial, please make sure all of the little trinkets are accounted for and returned to their proper home.

Thanks :)

If there isn't a bobbin with the thread you need, we're going to have to thread a new bobbin first

Place the spool on the rod at the back right of the machine

Use the metal pieces to thread the string and wrap it around the screw

Wrap the thread around the new bobbin and place it onto this nob snugly

Then slide the bobbin to the right until it locks into place

Use the peddle to thread the new bobbin as if you were operating the needle. When finished, unlock the bobbin and remove it.

Carefully slide the bobbin compartment to the left to remove it

Then open the compartment door to reveal the bobbin holder

It should look something like this

Remove the metal trinket in the center and place the bobby inside

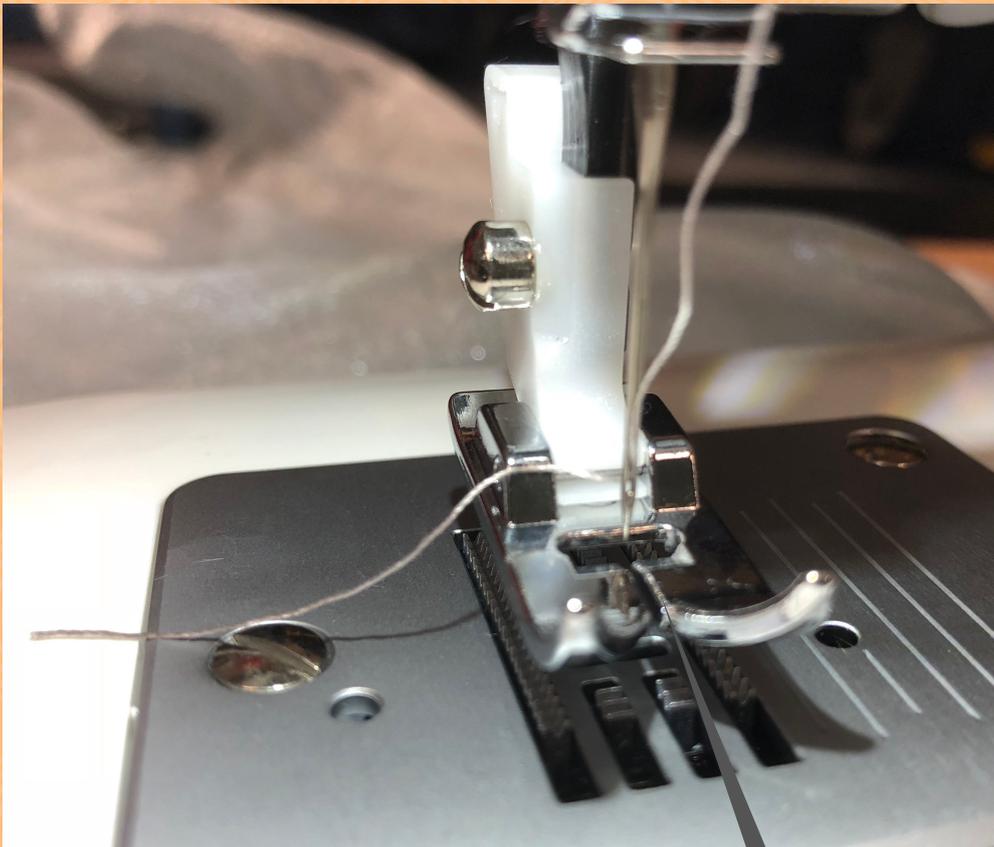

When you replace the metal trinket make sure it is fully snug into its original spot, otherwise it may cause damage to the machine when operated.

Use the arrow guides on the machine to thread the string until you're ready to insert it through the needle

P.S. If you are having trouble with this step, please consult the video tutorial provided by the QR code or visit <http://tinyurl.com/y2nxk9cf>

Thread the string into the needle. This may be difficult at first but keep at it!

Lastly, make sure the light is turned on before you begin operating! We all want you to keep your fingers!

Happy sewing! :)
