## Composite Squares produce multiple single-step Polygons and Polygrams

One obtains single-step images of rotating $\boldsymbol{G}$-sided polygons if $\boldsymbol{G} \cdot \boldsymbol{P}$ is one more or less than $\boldsymbol{n} \cdot \boldsymbol{S}$ with $\boldsymbol{J}=1$. When $\boldsymbol{J}>\boldsymbol{1}$, such images can either be polygons or polygrams. This explainer shows a trick that can be used to find multiple polygons if $\boldsymbol{n}$ and $\boldsymbol{S}$ differ by 2 and if the number in between (which we call $\boldsymbol{C}$ for center) is composite. The trick works because of a fact from algebra called the difference between squares formula: $(\boldsymbol{C}-\boldsymbol{b}) \cdot(\boldsymbol{C}+\boldsymbol{b})=\boldsymbol{C}^{2}-\boldsymbol{b}^{2}($ e.g., $19 \cdot 21=399$ or $18 \cdot 22=396)$.
When $\boldsymbol{b}=1$, this formula produces a number that is 1 less than a perfect square: $(\boldsymbol{C}-1) \cdot(\boldsymbol{C}+1)=\boldsymbol{C}^{2}-1$. Let $\boldsymbol{n}$ and $\boldsymbol{S}$ be the
 numbers on either side of $\boldsymbol{C}$ (it does not matter which is which but if you want to create as large a single-step $\mathbf{G}$-gon as possible, let $\boldsymbol{S}=\boldsymbol{C}$-1). Each factor of $\boldsymbol{C}^{2}(2,3,4,6,9,12$, and 18 for $\boldsymbol{C}=6$ ) can act as either the size of the $\boldsymbol{G}$-gon or the value of $\boldsymbol{P}$ necessary to produce that $\boldsymbol{G}$-gon as long as $\boldsymbol{P}>\boldsymbol{S} / 2$ so that successive lines have ends on different lines of the VF. Thus $\boldsymbol{J}=1, \boldsymbol{P}=3$, produces the 12 -gon at left if $\boldsymbol{S}=5$ and $\boldsymbol{n}=7$ but only the 9 -gon at right if $\boldsymbol{S}=7$ and $\boldsymbol{n}=5$ (since the $1^{\text {st }}, 3^{\text {rd }}$ and $4^{\text {th }} \mathrm{VF}$ lines have 2 segments each of the first 12 shown).

More generally, if $\boldsymbol{G}$ is a factor of $\boldsymbol{C}^{2}, \boldsymbol{S}$ and $\boldsymbol{n}$ are the numbers on either side of $\boldsymbol{C}, \boldsymbol{J}=1$, and $\boldsymbol{P}=\boldsymbol{C}^{2} / \boldsymbol{G}$ satisfies $\boldsymbol{P}>\boldsymbol{S} / 2$, then the resulting image is based on a clockwise rotating $\boldsymbol{G}$-gon image because $\boldsymbol{P} \cdot \boldsymbol{G}=\boldsymbol{C}^{2}=\boldsymbol{n} \cdot \mathbf{S}+\mathbf{1}$.
Varying $\boldsymbol{J}$. These images show the first 5 lines $(\boldsymbol{G}=5$ ) and VF for $\boldsymbol{J}=1$ to 6 given $\boldsymbol{n}=16, \boldsymbol{S}=14$, so $\boldsymbol{P}=45=(16 \cdot 14+1) / 5$. Similar images would have occurred had $\boldsymbol{n}=14$ and $\boldsymbol{S}=16$ been used. (Additional $\boldsymbol{G}$ are 3, 9, 15 and 25 given $\boldsymbol{C}=15$.)

Composite $\boldsymbol{G}$. When $\boldsymbol{G}$ is composite, interesting results happen when $\operatorname{GCD}(\boldsymbol{G}, \boldsymbol{J})>1$. For example, if $\boldsymbol{G}=\boldsymbol{C}=30$, the first 30 lines are: 130 -gon if $\boldsymbol{J}=1 ; 215$-gons if $\boldsymbol{J}=2 ; 310$-gons if $\boldsymbol{J}=3 ; 215$-grams if $\mathrm{J}=4 ; 56$-gons if $\boldsymbol{J}=5 ; 65$-gons if $\boldsymbol{J}=6 ; 103$ gons if $\boldsymbol{J}=10$; and 152 -gons if $\boldsymbol{J}=15$. Switching $\boldsymbol{n}$ and $\boldsymbol{S}$ produce similar images. But, a $\boldsymbol{G}=60$-gon ( $\operatorname{set} \boldsymbol{P}=15$ ) is possible only if $\boldsymbol{S}=29, \boldsymbol{n}=31$ and $\boldsymbol{J}=1$. In this case $\boldsymbol{J}=10$ is almost a 6,2 star.

| $\boldsymbol{C}$ | $30=2 \cdot 3 \cdot 5$ | $\mathbf{G}$-gon/ gram | 2 | 3 | 4 | 5 | 6 | 9 | 10 | 12 | 15 | 18 | 20 | 25 | 30 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\boldsymbol{C}^{2}$ | 900 | $\boldsymbol{P}=\boldsymbol{C}^{2} / \boldsymbol{G}$ | 450 | 300 | 225 | 180 | 150 | 100 | 90 | 75 | 60 | 50 | 45 | 36 | 30 |
