## Two Footballs Challenge Question

The Two Footballs explainer proposed a general rule for creating two footballs images. That rule was:
A general rule. Base two footballs images off of $\boldsymbol{J}$. These images occur when $\boldsymbol{n}=\boldsymbol{P}=3 \boldsymbol{J} \pm 1$ and $\boldsymbol{S}=2 \boldsymbol{J} \pm 2$ but are most visible when $\boldsymbol{J}$ is not too small.

This rule keys off of $\boldsymbol{J}$. Four images were shown but three images were of roughly the same size in terms of number of lines (determined by $\boldsymbol{S}$ ) and number of vertices in the underlying polygon, $\boldsymbol{n}$. These challenge questions ask you to focus your attention on $\boldsymbol{n}$ rather than $\boldsymbol{J}$.

The images shown there were created to highlight the different number of cycles that are possible by following the two footballs rule.

The values of $\boldsymbol{n}$ shown there were: $\boldsymbol{n}=247$ (top right); $\boldsymbol{n}=248$ (bottom right); and $\boldsymbol{n}=250$ (middle right).
Noticeably absent is $\boldsymbol{n}=249$. Of course, this may just be a byproduct of choosing images that show the various cycle outcomes shown in the explainer. Or is there something more going on?

Q1) Is it possible to find values of $\boldsymbol{S}$ and $\boldsymbol{J}$ satisfying the two footballs rule which has $\boldsymbol{n}=\mathbf{2 4 9}$ ?
Q2) Provide a general condition on $\boldsymbol{n}$ that guarantees that no $\boldsymbol{S}$ and $\boldsymbol{J}$ can be found that satisfy the two footballs rule and is consistent with that value of $\boldsymbol{n}$.
