## Three Shape-Shifting Triangles

The $(\boldsymbol{n}, \boldsymbol{S}, \boldsymbol{P}, \boldsymbol{J})=(30,19,163,13)$ image shows three shape-shifting triangles. The image is not shown below, and multiple Drawing Modes can help you understand how the image was constructed. Start with Fixed Count Line Drawing.

It is immediately clear that there are three triangular images involved and each changes its shape over the course of building the image. Instead of showing the image below, the vertex frame with subdivision points are shown together with the first 19 -segment cycle. The cycle is shown in three parts: the first part is 7 green segments followed by 7 red segments followed up by 5 blue segments ending at vertex 19 .

The triangles that are created vary over the course of the cycle but notice that all are scalene triangles EXCEPT the red isosceles triangle in the middle of the cycle. The base of that triangle is the $9^{\text {th }}$ and $10^{\text {th }}$ point of the cycle, the $9^{\text {th }}$ point is the end of the $4^{\text {th }}$ subdivision on the 11 to 24 vertex frame line and the $10^{\text {th }}$ point is the end of the $15^{\text {th }}$ subdivision 25 to 8 vertex frame line. Both points are at Level 4 . This process continues in the $2^{\text {nd }} \mathrm{cycle}$. That cycle ends at vertex $\mathbf{8}=\operatorname{MOD}(2 \cdot 19,30)$ and Level 4 isosceles triangle base is the $4^{\text {th }}$ point on the vertex frame line from $\mathbf{3 0 \& 0}$ to $\mathbf{1 3}$ and $15^{\text {th }}$ point on the vertex frame line from 14 and 27.
